No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Description

BGL2 protein; beta-glucosidase 2.
S.fibuligera (strain HUT7212) DNA, clones pSfbetaG[1,2,3,4].
Saccharomycopsis fibuligera
Eukaryota; Fungi; Ascomycota; Saccharomycopsis accharomycopsidaceae; Saccharomycopsis.

1 (bases 1 to 3371)
Machidam., Ohtsuki,I., Fukui,S. and Yamashita,I.
Nucleotide sequences of saccharomycopsis fibuligera genes for extracellular beta-glucosidases as expressed in Saccharomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Location/Qualifiers

The polymerase B proteins or SNI/SNF proteins
Claim 11; Fig 2C; 154pp; English.

Novel DNA aequences (T59904-11) code for yeast SRB (suppressor of NNA polymerase B) proteins SRB4, SRB5, SRB6, SRB9, SRB9, SRB9, SRB1 (W13821-28); respectively. SRBs are transcription regulatory factors that act as positive and negative regulators of RNA polymerase II activity. They are components of the RNA polymerase II activity. They are components of the RNA polymerase II activity. They are components of the RNA polymerase II c-terminal domain (CTD) function. A genomic clone polymerase II c-terminal domain (CTD) function. A genomic clone consuppress dominantly the cold-sensitive phenotype of a cell conty. SRB nucleic acids and RNA polymerase II holoenzymes can be used to treat diseases resulting from alteration or deletion of the genes can be used to detect SRB nucleic acids.

SRB genes can be used to detect SRB nucleic acids.

Detection and isolation of active gene - by physically mapping a specific region on chromosome and detecting and isolating gene between sequence represents a base sequence from the human companies. The present sequence represents a base sequence from the human concomments of the present invention describes a method for detecting and isolating an active gene in which an uncommon restriction ensymetis prepared. The method comprises: (a) physically mapping a specified region of a chromosome and the base sequence upstream and downstream of the restriction ensyme site within the map, and (b) detecting and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated heregulin-like factor - used to develop products for the diagnosis and treatment of disorders involving regulation of cell growth, particularly cancers.

Claim 2: Page 86-87; 118pp; English.

This sequence encodes the human heregulin-like factor (HLF) of the linvention. The HLF is involved in the regulation of cell growth. Detection of different levels of expression of the HLF gene can be used for the diagnosis of disorders, e.g. in the neural system. In particular, detection of different levels of HLF gene can be used for the diagnosis of an individual can be used for diagnosing cancer. The products can also be used in the treatment of disorders involving

```
20-JUN-1991 (first entry)
Sequence of clone encoding alcohol oxidase, MOX enzyme.
Oxidoreductase; bleaching; detergents; dihydroxyacetone synthase;
alcohol axidase; MOX; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       composes. by recombinant DNA technology
Disclosure; fig 11; 54pp; English.
This sequence is contained in a plasmid along with regulatory
DNA, e.g. a sequence allowing autonomous replication in host
cells, for recombinant prodn. of MOX in high yields. MOX catal-
yses the oxidation of methanol to formaldehyde and hydrogen
peroxide in the bleaching process and is useful in bleach and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1069 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Oxido-reductase prepn. - for use in bleaching and/or detergent

                                      New DNA sequences coding for oxido:reductase(s) and other enzyme(s) - useful for expression in microorganisms to give high yields for bleaches and detergents.

The sequence encodes the alcohol-oxidase gene, which is used (in combination with its regulatory sequences and/or those of microorganisms that produce oxidases or other enzymes in yields that allow industrial application on a large scale. The engineered allow industrial application on a large scale. The engineered to their application in oxidation reactions and/or in bleaching and

Claim 1; Page 175-179; 748pp; English.

This sequence represents a Herpes simplex virus type-2 (HSV-2) DNA sequence of the invention. This sequence was isolated from HSV-2 strain SB5 (deposited as APCC VR-2546), is designated Contig ID 101, and encodes 8 HSV-2 proteins. The proteins can be used for the treatment or prevention of disease, to induce an immunological response in a mammal or to identify inhibitors, activators or novel antivirals. Antagonists of the proteins can be used to inhibit a viral polypeptide. The DNA sequence or a vector containing it can also be used to induce an immunological

This sequence was isolated from HSV-2) DNA sequence of the invention. This sequence was isolated from HSV-2 strain september of the invention. This sequence was isolated from HSV-2 strain SBS (deposited as ATCC VR-2546), is designated Contig ID 2, and encodes ID HSV-2 proteins. The proteins can be used for the treatment or to dentify inhibitors, activators or nowel antivirals. Antagonists of the proteins can be used to inhibit a viral polypeptide. The DNA sequence or a vector contraining it can also be used to induce an immunological response in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      08-JAN-1999 (first entry)

NAME OF THE PART O

11-FEB-1999

```
X1787 to X52019 represent 5 secreted broteins given in Y12987 to Y1319, secreted proteins, and encode the proteins given in Y12987 to Y1319, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopolesis regulating activity, tissue growth regulating activity, chemotractic/chemokinetic activity haemostatic and thrombolytic activity. receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy or other activities. The products can be used in forensic, gene therapy the signal peptide can be used for directing extracellular secretion of the signal peptide can be used for directing extracellular secretion of a polypeptide into a membrane, or importing a polypeptide into a cell.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              P-PSDB; P81068.

New physiologically active polypeptide used as antitumour agent -
obtd. by culturing recombinant Escherichia coli cell transformed by
plasmid contg. DNA region coding the polypeptide
Claim 2 (4); Page 670; 20pp; Japanese.
A recombinant microorganism cell transformed by recombinant plasmid
contg. the DNA region coding for the polypeptide is cultured. The
polypeptide is isolated from the resulting culture. The microorganism
                                                                                                                                                            products
                                                                                                                                                    New isolated brain-derived nucleic acids - used to develop in which may have cytokine, immune, regulatory, haematopoiesis regulating, anti-inflammatory or tumour inhibition activity claim i; Page 255; 577pp; English.

New isolated Treponema pallidum nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of T. pallidum infections, particularly syphilis claim 1; Page 840-841; 1150pp; English.

X20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrelia infections in animals, and for the production of biosynthetic products such as enzymes.

Sequence 2535 BP; 651 A; 831 C; 597 G; 455 T;
               05-WAY-1999 (first entry)
Polynuclectide sequence from the genome of Treponema pallidum.
Treponema pallidum infection; syphilis; Borrelia infection; animal; enzyme production; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This polynuclectide encodes a thermostable phosphatase, designated 31phl, of Thermococcus 9N-2. The invention relates to claimed 31phl, of Thermococcus 9N-2. The invention relates to claimed 31phl, of Thermococcus 9N-2. The invention relates to claimed belonged clotdes (see V03301-20) coding for novel thermostable phosphatases (see W42380-95). Claimed vector and host cells are used to produce the enzymes, which can be used in a claimed method to hydrolyse phosphate bonds. They can also be used in enzyme labelling processes, in certain recombinant DNA techniques, in ELISA immunoassays, in enzyme linked gene probes, in research applications for removing 5' phosphates in polynucleotides prior to baking industries. Polynucleotides can also be used as probes. Sequence 5520 Bp; 1297 A; 1491 C; 1587 G; 1145 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               22-50N-1998 (first entry)

                                                                                                                                                                                                                                                                                                                             Fraser CM;
New polynucleotides encoding human secreted proteins - derived from
e.g. human blood, kidney, foetal lung, placenta, testes, brain,
e.g. human blood, kidney, foetal lung, placenta, testes, brain,
ovary, pituitary, retina and colon cDNA libraries.
Claim 1; Page 151; 618pp; English.
The present sequence represents a human expressed sequence tag (EST).
The present sequence represents a human expressed sequence tag (EST).
The polynucleotide, which is a secreted EST, and the encoded protein
are predicted to have useful biological activities which would make
them suitable for treating, preventing or ameliorating medical
conditions in humans and animals, although no supporting data is
given. Suggested activities include nutritional activity, immune
stimulating or suppressing activity, haematopolesis regulating
activity, tissue growth activity, haematopolesis regulating
activity, receptor/ligand activity, activin/inhibin activity,
cadherin/rumour invasion suppressor activity, unmour inhibition
cativity. The polynucleotide may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EST clone CH421.

The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (752134 to V52524) recorded on it, or a representative fragment or a sequence at least 95% identical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO:1 to 391 (V52134 to V52524) are genomic fragments from Streptococcus monemonate. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         by a process comprising: (a) acreening agenomic DNA library using as probes a target sequence defined by any of the sequences in SEQ ID NO:1 to 31, identifying members of the library which contain sequences that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating mRNA, DNA or cDNA produced from an organism, amplifying nucleic acid molecules whose nucleotide sequence is homologous to amplification primers derived from the fragment of the S. pneumoniae genome to prime the amplification and isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   5. pneumoniae genome of commercial importance, or expression modulating fragments of the S. pneumoniae genome. Products from the present invention can be used in diagnosis kits and assays, and pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             30-CT-1997; U19588.

/clone_lib="normalized Xenopus laevis gastrula"
/tissue_type="gastrula (stages 10.5, 11.5 mixed)"
/lab_lost="Yop:10 F."
/note="Wettor: pBluescript SK-; Site_1: ECORI; Site_2:
XhOI; CDNA was prepared from 2ug of poly A+ RNA (equal parts from stage 10.5 and stage 11.5 gastrulae).
ECORI.XhOI cut CDNA was then ligated into UniZap-xR (Stratagene) with ECORI at the 5' end and XhOI at the 3' end. SS-library phagemids were prepared by mass excision from the original library and normalized by hybridization to blotinylated driver (prepared from the same library by PCR) to Cot-omega of 11. After removal of hybrids and excess driver by streptavidin sepharose chromatography, the ss-phagemids were made double stranded and electroporated into Top-10 F'. Original library contruction by Bruce Blumberg (Cho et al. 1991 Cell 67, 111-1120). Normalized by Jihwan Song (Song, Cho and Blumberg, unpublished)."

//note="Vector: pBluescript SK-: Site_1: EcoRI; Site_2:
XhOi; cDNA was prepared from Cop poly A+ RNA (equal parts from stage 10.5 and stage 11.5 gastrulae).
ECORI.xhOi cut cDNA was then ligated into Unlap.xR
(Stratagene) with EcoRI at the 5' end and XhOI at the 3' end. SS-library phagemids were prepared by mass excision from the original library and normalized by hybridization to biotinylated diver (prepared from the same library pCR) to Cot-omega of 11. After removal of hybrids and excess driver by streptavidin sephancose chromatography, the ss-phagemids were made doluble stranded and electroporated into Top-10 F'. Original library contruction by Bruce Blumberg (Cho et al. 1991 Cell 67, 1111-1120). Normalized by Jihwan Song (Song, Cho and Blumberg, unpublished)."

libraries constructed from rat placenta, adult lung, brain, liver, kidney, heart, spleen, ovary, and muscle. The UI-R-EI library consisted of a mixture of individually tagged normalized libraries constructed from 8, 12 and 18-day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dT track which allows identification of the library of origin of a clone within the mixture. The subtracted ilbrary (UI-R-CI) was constructed as follows: PCR amplified colon miserts from UI-R-CO clones from which 3' ESTs had been derived was used as driver in a hybridization with the UI-R-CO library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated the UI-R-CI library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6: 791-806,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   on Sep 12, 1996 this sequence version replaced gi:1392727.

of mRNA was used for cDNA synthesis. Stratagene's cDNA synthexix Kit (catalog number 200401) was used to synthesiz kit (catalog number 200401) was used to synthesiz the cDNA. First- stranded synthesis was performed with 5-methyl dCTP, hence the ligated cDNA was hemimethylated. A modification of Stratagene's first-strand synthesis primer was used. An anchor nucleotide (V-A, C, or G) was added to the 3' end of the primer ight of the poly(A) tract. After second-strand synthesis, the cDNA ends were filled in with cloned Fu DNA, ligated to ECORI adapters and subsequently phosphorylated. The XNOI site within the first-strand synthesis primer was then restricted by digestion with XNOI; all XhoI sites in the cDNA would be protected by their hemimethylated status. The cDNA constructs were size-fractionated with 500 bp cutoff, using GibcoBRL Life Teachhologies' CDNA Size Fractionation Stratagene's spaluescript(tm) II XR Predigested vector (PBluescript II SK(+) that has been digested with EcoNI and XhoI, and phosphorylated by Stratagene's 97% of the white and blue colonies appear to contain recombinant plasmids with cDNA inserts, based on size (n-30). This library was constructed by DI. Paul Keim and DI. Virginia Coryell."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Medicago truncatula

Rice is the most important food crop in the world. Half of
Rice is the most important food crop in the world. Half of
the world population, especially those inhabiting highly
populated areas of the humid tropics and subtropics, rely
on rice as their primary source of carbohydrate.

Monocotyledonous rice is a diploid plant (2n=24) with a
haploid genome equivalent of 431 Mbp (Arumqanathan and
Earle, 1991). The relatively small genome of rice, three
times larger than that of Arabidopsis, makes it suitable
for genomic studies. In order to facilitate positional
cloning, physical mapping and genome sequencing of rice,
we have constructed a BAC library from Oryza sativa,
Nipponbare variety using EcoRI as the cloning enzyme. The
library contains 55,296 clones with an average insert size
of 121 Kb providing approximatley 15 haploid genome
equivalents. The deep coverage allows the isolation a
particular sequence with a probability of 99.9 %. Three
high density filters, each containing 18,432 clones
(doubly spotted), represent the whole library for colony
screening and can be requested from the Clemson University
BAC/EST Resource Center (www.genome.clemson.edu)."

Compans. comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLs.

Example: Page 11: 29pp: English.

This sequence represents the alphal-helix of the human-leucocyte-associated antigen B2702 (HIA-B2702). This sequence, epitopes, and palindromes of it (such as R95428) can be used to isolate the protein p74 from a T-cell yaste. p74 is a T-cell surface membrane protein p74 from a T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein HSC70. p74 is found in a limited number of cell types, but is particularly expressed on B and T cells. p74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HIA-B2702 palindromic peptide.

Compositions comprising the extracellular fragment of p74 combined with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCS). by adding to the mix the extracellular portion of p74, in a manount sufficient to compete containing the binding of the p74 in a mount sufficient to compete containing the binding of the p74 in a manount sufficient to compete containing the binding of the p74 in a manount sufficient to compete containing the mix he extracellular portion of p74, in a manount sufficient to compete containing the binding of the p74 in an amount sufficient to compete containing the binding of the p74 in an amount sufficient to compete containing the binding of the p74 in an amount sufficient to compete containing the mix he extracellular portion of p74.
                                                                                                                                                                                                                                                                                                                                                                                        ö
                                 Claim 15; Page 9; 80pp; English.
R83061-R83085, R83096, and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HIA: p74; alphal-helix; human-leucocyte-associated antigen; inhibitor; recal lysate; membrane protein; mammal; heat shock protein; Hsc70; APC; B cell; calcium influx; cytotoxic I lymphocyte; CTL; differentiation; cytolysis; antigen presenting cell.

Treatment of auto-immune disease by admin. of peptide(s) corresp. to major histocompatibility complex antigens - esp. for delaying onset of clinical symptoms of insulin dependent diabetes by modulating T cell mediated attack on target cells

Claim 7: Page 20: 24pp: English.

WO7512-W07518 represent T-cell modulating peptides that can be used in the method of the invention. These sequences are based on a portion of the method of the invention. These sequences are based on a portion of the method of the invention. These sequences are based on a portion of the method of the invention. These sequences are based on a portion of the method of the invention of tissue in mammals. These involving T-cell mediated destruction of tissue in mammals. These peptides are used especially to treat insulin-dependent diabetes mellitus, preferably being administered during the pre-clinical stage to delay onset of the disease. Other diseases that can be treated are militus, preferably being administered during the pre-clinical stage to delay onset of the disease, Other diseases that can be treated are multius, etc. The peptides modulate T-cell mediated attack on autologous gravis, etc. The peptides modulate T-cell mediated attack on autologous cavics, performs, performins, granzymes etc. associated with T cell activation. Sequence 10 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          T-cell modulating peptide #1.

T-cell modulator; autoimmune disease; tissue destruction; alphal-domain;

T-cell modulator; autoimmune disease; tissue destruction; alphal-domain;

mammal; major histocompatability complex; MHC class I; antigen; perforin;

insulin-dependent diabetes mellitus; multiple sclerosis; inflammation;

rheumatoid arthritis; psoriasis; pemphigus vulgaris; Sjogren's disease;

thyroid disease; Hashimoto's thyroiditis; myasthenia gravis; granzyme;

autologous target cell; cytokine release; r cell activation; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Novel immunomodulatory peptide-type compound - useful for inhibiting
                                                                   The present sequence is an immunomodulatory peptide, which comprises a Class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in
                                                                                                                                                                                                                                                                                          19-JUN-1998 (first entry)
Peptide B2702.75-84 tested for immunomodulating activity.
Immunomodulating dimer. Immunosuppressant drug; CTL activation;
transplantation; autoimmune disease; Class I MLA-B alpha-1 domain;
                                                                                                                                                                                             ö

Yothotoxic T jumphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HIA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 15; Page 36; 80pp; English.
R8306-R83085, R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 70-84 of the alpha-1 domain of the class I MHC HIA-B3702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Peptide BS702.70-84 tested for immunomodulating activity.
Immunomodulating dimer: immunosuppressant drug; CTL activation; transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New immunomodulating dimer peptide(s) - based on a Class I HLA-B alpha-1 domain, used for preventing rejection of transplants or

R83061-R83085, R83090-R83096 and R92207-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702.

These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (comparate to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CILS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      HLA-B2702 CTL modulating peptide (B2702.84-75/75-84).
